

Kestrel tipsheet

Handy commands to remember while using Kestrel-cli

You can list all commands by running `swoop` or `swoop --help`

Updating

```
sudo npm update kestrel-cli -g
```

Check the version you're using

```
swoop -v or swoop --version
```

Initialize a project

```
swoop init.
```

This will:

1. Create a `.kestrel` folder in your project (if not already done)
2. Initialize `git` locally (if not already done)
3. Create a GitHub repo (if not already done)
4. Set up the webhook (if not already done)

You can run `swoop init` multiple times without worry of messing something up. If one or multiple steps have already been done, Kestrel will simply skip that step.

Deploying

```
swoop deploy
```

Archiving

```
swoop archive
```

Unscheduler

```
swoop unschedule
```

Update your settings

```
swoop config
```
